MealJi API: release steps and modules

The customer app's APIs in the order the app team integrates them, released one step at a time (Step 01 to Step 17), followed by the platform, kitchen console and admin console APIs. Same grouping and request numbers (S05.1 …) as the Postman collection.

Base URL `<host>/api/v1` (local `http://localhost:4000/api/v1`). Health and public links sit at the host root. App calls need a customer token and an `x-device-id` header; `:name` marks a path parameter.
